

Abstract of the Disclosure

1  
2 A method for building a product tracking data history has steps that  
3 include installing a remotely operable diagnostic tool on the product which  
4 may be remotely operated during the product manufacture process to report  
5 certain product specification data. The method also has steps of placing  
6 product assembly specifications and performance testing protocols on a central  
7 data repository for remote access by the product assembler, thereby reducing  
8 data transfer associated costs and efforts and eliminating uncertainties  
9 regarding which assembly specifications and performance test protocols are  
10 being used by an assembler.
